# 1 Data Sources

To build the dataset, we rely on micro-level event data reported by two different organizations: the Meir Amit Intelligence and Terrorist Information Center in Israel and the Negotiations Affairs Department<sup>1</sup> of the Palestinian Liberation Organization. Both organizations have consistently released reports documenting the “terrorism” and “Oslo violations” perpetrated by the other side, respectively, since 2009.<sup>2</sup> For its part, the Meir Amit Center publishes a weekly report entitled *News of Terrorism and the Israeli-Palestinian Conflict*. The reports are published incredibly consistently. In the Israeli data, there are between 0-1 missing reports per year. Since these reports are weekly, that means each year has been 0-8 missing days.<sup>3</sup> This report documents political developments in the ongoing conflict as well as protests and political violence perpetrated by Palestinians. A sample report can be seen in Figure 1. The descriptions of Palestinian violence typically include information on the type of violence (e.g. stabbing, shooting), location, casualties, and whether the perpetrator was apprehended.

The Negotiation Affairs Department (NAD) data is even more detailed. A unit within the department, the Palestinian Monitoring Group, produces a daily ‘violations’ report that typically includes 50+ actions by Israeli forces (the IDF), the Israeli police or judicial system, or civilians (typically Jewish settlers living in the West Bank) against Palestinians in Jerusalem, the West Bank and the Gaza Strip. These reports included very low-level negative interactions including harassment or trespassing, but also reports much more severe violence (e.g. air raids or shootings). As with the Meir Amit reports, these briefings include information on the type of violence, time, location, perpetrators and victims.

---

<sup>1</sup>This department was established in 1994, alongside the rest of the Palestinian Authority, following the signing of the Oslo Accords. The department has branches in both Gaza and the West Bank (Ramallah), allowing it to track activity in both areas. The official head of this department is Saeb Erekat, a Palestinian diplomat who is also the secretary general of the Palestinian Liberation Organization.

<sup>2</sup>The NAD database actually extends back further, to 2002, but English translation is less consistent until 2009, and the Meir Amit database only begins in 2009.

<sup>3</sup>During periods of heavy fighting, the reports often switch from weekly to daily. When events are drawn from a daily, rather than weekly, report, this is indicated in the “Other.Source” variable. Numbers are often reported in less detail in these reports. For example, rather than saying 52 rockets were fired, it might report that ‘hundreds’ were fired. In cases like this, coding was conservative, such that hundreds = 200.

The reports are also published very consistently. In the NAD data, each year contains anywhere from zero to 23 missing daily reports, providing a detailed daily-level picture of political violence on the ground. One important exception is the 2009 data from NAD, for which reports are missing for most of the year, likely due to the aftermath of Operation Cast Lead. See Table 1 for details.

**Table 1:** Number of Missing Dates Per Year

<b>Year</b>	<b>Meir Amit</b>	<b>Missing Dates</b>	<b>NAD</b>	<b>Missing Dates</b>
2009	0	NA	206	Numerous

## 1.1 Sample Reports

THE MEIR AMIT INTELLIGENCE AND TERRORISM INFORMATION CENTER  
AT THE ISRAELI INTELLIGENCE HERITAGE AND COMMEMORATION CENTER

### News of Terrorism and the Israeli-Palestinian Conflict (March 20– March 26, 2019)

#### Rocket Fire

##### Rocket and mortar shell fire into Israeli territory

► Before dawn on March 25, 2019, a rocket was fired from the Gaza Strip into Israeli territorial. Sirens were sounded north of Tel Aviv. **The rocket hit a house in one of the local communities. Seven people were wounded, including two small children.** The house was extensively damaged. It was the first time the sirens were sounded in the area since Operation Protective Edge (July-August 2014). **The rocket was apparently launched from Rafah, a distance of 120 kilometers (about 75 miles) from where it landed.**

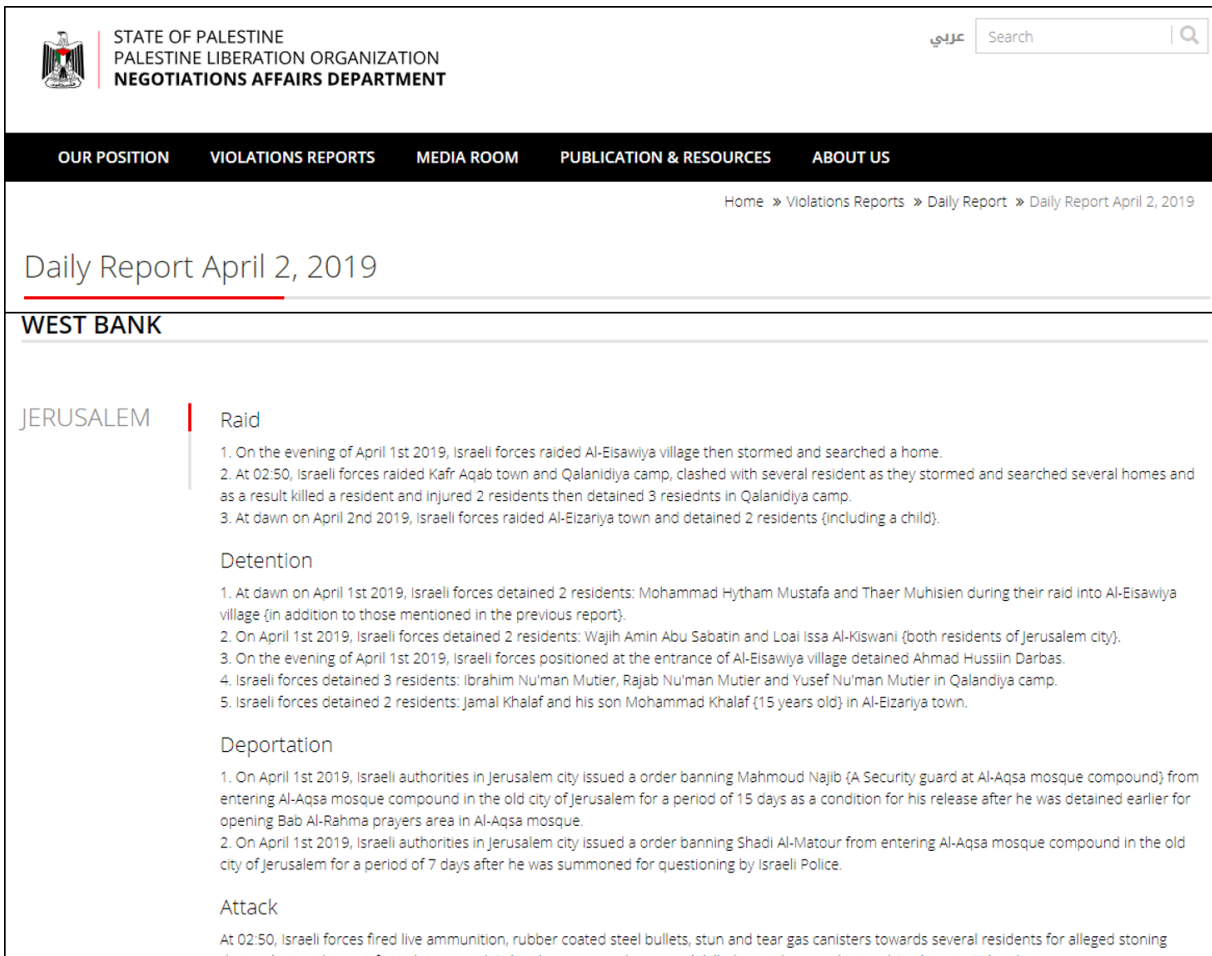

► The rocket launch led to a strong Israeli response, which included attacks on dozens of Hamas and PIJ targets in the Gaza Strip. In response **the terrorist organizations launched about 70 rockets and mortar shells into Israeli territory.** No casualties were reported. A house in the southern Israeli city of Sderot was hit.<sup>1</sup>

##### Other events on the ground

► In Judea and Samaria Palestinians continued throwing stones and Molotov cocktails at Israeli security forces and civilian targets. Israeli security forces carried out counterterrorism activities throughout Judea and Samaria, detaining Palestinians suspected of terrorist activity, confiscating funds used to finance terrorist activities, and seizing military grade and improvised weapons. The more prominent events were the following:

- ◆ **March 25, 2019** – During Israeli security force searches in **Bayt Fajjar and Abu Dis**, improvised and military-grade weapons were seized (IDF spokesman, March 26, 2019).
- ◆ **March 24, 2019** – Four Molotov cocktails were thrown at vehicles on the **Gush Etzion-Hebron road** near the al-Aroub refugee camp. No casualties or damage were reported (Rescue Without Borders, March 24, 2019).

**Figure 1:** Sample Meir Amit Center Report

**Figure 2: Sample NAD Report**

## 1.2 Potential Bias in the Data

These data are not unbiased. Indeed, the goal of these organizations in publishing these reports is *explicitly political* in nature. For example, on the NAD website, the authors expressly state their hope that, “by building a system of information, the PMG will also be able to help PNSP<sup>4</sup> and others develop strategies for the use of key information to achieve an effective political impact.” Thus, these data are almost certainly biased to *over-report* or, at least, exaggerate levels of Israeli violence. This same process occurs on the Israeli side, at the Meir Amit Center. This center was

<sup>4</sup>Note: this is an abbreviation for the Palestinian Negotiations Support Project, which is a project founded in 1998 and funded by England, Denmark, the Netherlands, Norway and Sweden, to “provide highly professional legal, policy and communications advice to the NAD and Palestinian negotiators in preparation for, and during, Permanent Status negotiations with Israel.”

established in 2002 and is part of a broader institute called the Institute for Research of Intelligence and Policy founded to commemorate fallen Israeli intelligence officers. Though the aim of the MAC is less explicitly political — in their words they aim to “collect, study, and disseminate information mainly about terrorism and intelligence” — the organization in fact maintains close ties to the Israeli Defense Forces. Many of its employees (including the director) are former intelligence officials and some have speculated that the organization serves, in part, as a pipeline for the publication of information the IDF prefers to have indirectly released.<sup>5</sup> As such, again, the direction of any potential bias in their data would also be to over-report or over-exaggerate levels of Palestinian violence. Indeed, the fact that both organizations publish these reports *in English* speaks volumes about the purpose of these efforts.

Because of these potential directional biases, machine coding of this data is quite difficult, as evidence of bias is often quite subtle. As such, all events were coded manually by coders who had been trained to recognize and account for bias in the texts. Each event was also cross-validated by a second coder to reduce errors. One example of these potential biases is that both organizations often inflate the number of injuries in their reports by counting, on the Israeli side, individuals who were ‘treated for shock’ and, on the Palestinian side, individuals who were ‘suffocated from tear gas.’ In both cases, coders were instructed not to include those individuals in the injured column unless these experiences resulted in some other injury (e.g. the individual had a heart attack and was hospitalized). Information in the Palestinian reports was also often repeated. For example, a raid that led to a detention would be listed under both raid and detention. As such, coders needed to carefully parse these documents to avoid double-coding. Moreover, events that occurred every day for weeks or months on end were also not coded, such as when a major crossing to Gaza from Israel was closed, as this too would have inflated the number of unique events. In these cases, the first instance of the closure was coded, but subsequent days with closures were not. On the Israeli

---

<sup>5</sup>“Under Ehrlich’s management, the information center has become a “pipeline” for information and assessments that the Military Intelligence research division does not want directly associated with it. Thus, for example, Military Intelligence transferred documents on terror organization activities captured by the Israel Defense Forces in Jenin during Operation Defensive Shield to Ehrlich’s center, where researchers can study them. *Source: The Terrorist Kills, and the Bank Pays.*

side, reports of ‘incitement’ or wholly non-violent protests (such as flotillas purposefully aiming to break the Gaza blockade) were also not coded.

On the other hand, some data was coded *conservatively*, which, as a result, likely overestimates some types of violence. For example, all (or nearly all) Palestinian protests are described as — and coded as — riots, even if they were largely non-violent. That is, if any type of violence is reported at a protest, we will record it in our data under the Riot category, with further clarification in the Riot Sub-Category (e.g. as a ‘Violent Protest’). On the other hand, all (or nearly all) incidents of Israeli soldiers entering Palestinian villages are described as — and coded as — raids, even if these are largely non-violent patrols that do not result in arrests, injuries, or entry into private property. Another category that is likely inflated is the detention of Palestinians, as Palestinians are reported to be detained regardless of how long the time period was. So, for example, Palestinians are reported as detained if they are searched at a checkpoint or asked for additional identification. Palestinians summoned for questioning are also coded as detained, even if this detention is for a short time period.

These coding decisions were made, in part, because the dataset is constructed to examine the subjective perceptions and lived experience of violence on each side. Israelis typically see Palestinian protests as riots, even if the vast majority of protesters are peaceful. Palestinians see Israeli soldiers entering their village as conducting raids, even if they are just patrolling or issuing summons. Detentions are traumatic and stressful for Palestinians even if they are relatively short. Practically, there was also not enough information to parse the data to determine what was a true or traditional “raid” (or detention, or riot) and what was mere presence or less aggressive activity.

## 2 Inclusion Criteria

In total, the dataset includes information on 5,419 cases of Palestinian political violence and 181,907 Israeli actions against Palestinians from January 1 2009 until December 31 2020. Since we suspect there are some missing reports in early 2009, we have restricted our analyses to start

from January 1 2010 through December 31 2020. This yields 4,984 cases of Palestinian political violence and 175,344 cases of Israeli actions against Palestinians.

Events that are often discussed in the reports but which are not included in this data are:

- Wall construction or settlement activity, such as the approval of new housing or the development of additional cities, which the NAD reports usually list under a separate category of Wall Construction/Settlement Activities.
- Non-violent actions by Israelis or Palestinians (including protests with no violent elements, instances where photos or videos were taken by Israeli forces without any other confrontation, etc.)
- Diplomatic developments or statements by public officials (including those deemed “Incitement” by the Meir Amit reports)
- Events where the only description is “Israeli forces stormed XX” with no other details about detentions, entering private property, or confrontations with anyone in the area were not coded. Stormed is typically used as a verb meaning “arrived” or “came,” contrastingly, raids are explicitly reported as “raids.”

This dataset does, however, include actions by settlers that amount to harassment of the local community — including attempted forced confiscation of land, trespassing, and theft. It also includes planned violence by Palestinians that is prevented or preempted prior to the launching of an attack by Israeli forces. Casualties are *not* required for an event to be included in the dataset; in fact, most events in the dataset result in no injuries or deaths.

### 3 Replicability & Reliability

A team of undergraduate coders working over a period of five years<sup>6</sup> manually coded each report from the Meir Amit Center and Negotiation Affairs Department, using a unified coding scheme to construct the PA’ILIM data.

---

<sup>6</sup>Coding began in May 2016 was completed in August 2021

In addition, weekly meetings were scheduled between the coders and PI to discuss questions and the coding of difficult-to-classify events. Coders used the “Comments” column to leave notes and questions for discussion. This led to the creation of an additional coding notes worksheet, which addresses FAQs and provides detailed, replicable instructions for the classification of these difficult cases.

The FAQ includes items such as:

- Violence by settlers is usually coded as *Harassment* or *Assault* (as opposed to *Raid*), even if the report uses the term raid.
- When “Israeli Naval vessels opened fire towards Palestinian fishing boats,” code this as *Naval Blockade* with a secondary classification as *Shooting*.
- When the text says “Israeli forces set up a checkpoint...”, code as *Flying Checkpoint*, not *Military Checkpoint*, which is restricted to new activity at permanent checkpoints.
- If *Crowd Dispersal* happens because of stoning that happens during a raid, *Raid* is primary, *Crowd Dispersal* is secondary and Israeli actions should be coded as independent (e.g. pre-planned, not simply responsive to events on the ground).
- If two reported events were less than three hours apart in the same location, the events were coded as a single event. Any events more than three hours apart in the same location or at the same time in multiple locations were coded as separate instances.<sup>7</sup>

Finally, all events were cross-validated by a different coder to check for errors or missing information. As such, each event in the dataset is coded by two different individuals. In addition, all events in the dataset have columns for the original source material (Verbatim.Text) and link to the original report (Link.Report).

One of the most complex issues – and the reason the reports required manual rather than automated coding – was avoiding double-coding single events. First, double-coding was prevented initially by assigning one full report to one coder. This was an essential step as in the NAD reports,

---

<sup>7</sup>For example, if there was a flying checkpoint at 12pm and 1pm in Jenin, this was coded as one flying checkpoint in Jenin. For example, a flying checkpoint set up at 9am “and again at” 9pm was coded as two different events.

events with multiple types of violence would be listed under both the “Raid” and “Detention” sections of the report with slightly different wordings. Similarly, in the Meir Amit reports events are often reported in text and, for certain types of violence such as rockets and balloons, are reported again in graphs. Thus, coders were instructed to compare date, time, and location as well as more general contextual information to discriminate novel events from duplicate listings. Further errors in double coding or coding events outside of the inclusion criteria was identified via cross-validation.

## **4 Database Variables**

The PA’ILIM data is constructed as two separate datasets, with slightly different variables in each, to reflect the different options available to each actor. Nonetheless, the two datasets are highly comparable and many variables overlap across both.

### **4.1 Case ID**

Each case was provided a unique Case ID, from 1 to the number of events in the dataset.

### **4.2 Coder & Cross-Validator Number**

Each event in the PA’ILIM dataset is coded by one coder and then cross-validated by a second coder for validity. There are 49 coders, with each given a unique numerical identifier (Coder.ID, Cross.Validator.ID). This value can be used to account for any potential coder specific events in the classification of the data.

### **4.3 Date**

Each event in the PA’ILIM dataset has information on the date the event occurred (Date). The date of the event takes the form YYYYMMDD in our dataset. In addition, separate variables list the Day (DD), Month (MM) and Year (YYYY) of each event.

In the NAD reports, which are compiled daily, assigning a specific date is straight-forward. Events that occur between 8am and midnight are assigned to the previous day (e.g. the day before the report was released) and events from 12:01am to 7:59am are assigned to the same day the report was released.

In some cases, there are clear typos, ambiguously timed events, or events that lack any time stamp, and updates to earlier acts of violence in the reports which need to be manually corrected. Typos are typically distinguishable from regular reporting as dates assigned to these specific violent events are in the future. For example, a report from December 12th, 2015 may describe a raid that occurred on December 20th, 2015. In these cases, coders or cross-validators were instructed to review the Arabic version of the report for further context when translated. Often, these typos were clear translation or copy errors that were easy to fix. Similarly, events reported at exactly 8am or with no specific date stated were assumed to have occurred on the day prior to the report's publishing. In other cases, NAD reported updates to previously covered events if a victim eventually died from injuries sustained during the original act of violence, injuries were discovered after the event was originally reported, or an individual was arrested/deported following a previously recorded encounter with Israeli forces. In most, if not all, of these cases the reported text included the date of the original event, and it was explicit how the original coding should be updated. For example, if a death occurred months later from sustained injuries, the original instance was updated to indicate +1 victim killed and -1 victim injured with the updated verbatim text and link to report added.

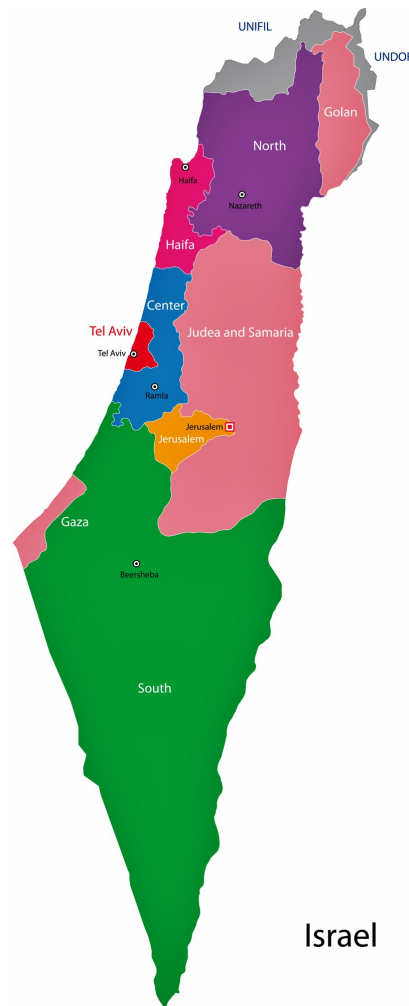

In the Meir Amit reports, which are compiled weekly, assigning a specific date sometimes presented additional challenges. **CARLY: DESCRIBE SOME OF THE CODING CHALLENGES AND RULES HERE.**

## **4.4 Location**

Each event in the data contains information on the location. In the Palestinian violence dataset (generated from the Meir Amit Reports), information on “Region” and “City” are collected. Region can take on one of the following values: North, South, Center, Golan Heights, West Bank,

Gaza Strip, or Abroad. Figure 3 shows a map of Israel's region. In our dataset, the Haifa region is included as part of "North" and Tel Aviv and Jerusalem regions are included as part of "Center." Judea and Samaria (as Israelis call it) is the West Bank.

It is also important to note that the political and social complexity surrounding these borders, in some cases, required greater nuance to tag the violence within one of our defined regions. The primary example of this contextualized categorization occurred with violence reported in the East Jerusalem area. Since East Jerusalem is generally still recognized as a part of Palestinian territory, Palestinian violence reported in the area was coded as "West Bank" not "Center," unless violence occurred in the Old City of Jerusalem (these incidents were coded as Region = Center). Furthermore, some forms of violence were not localized to the region where the attack originated. Rocket fire and incendiary balloons were often used to attack targets in a different region. The most common example of these cross regional attacks included rocket fire from the "Gaza Strip" targeting various parts of the "South" or "Center" region. To capture the detail in these cases, the location of the violence was coded as the intended region (e.g. "South") rather than the region of origin (Gaza Strip). If rockets fell within the Gaza Strip, the region was coded as Gaza Strip. In cases where rocket fire or similar long-form attacks landed in multiple regions, the event was coded under each reported region and or city with associated details of the violence separated accordingly. If no cities were specified in the report, then the finest level of coding for these events would be at the region level.

**Figure 3:** Regions of Israel

In the Israeli violence dataset (generated from the NAD Reports), information on “Area,” “Governorate,” and “Town” are collected. “Area” represents Areas A, B, C as laid out in the Oslo accords signed by Israel and the Palestinian Authority in 1993 and 1995. In theory, Area A is exclusively administered by the Palestinian Authority, Area C by the Israelis, and Area B jointly by Israel and the PA. However, in practice the borders of these areas are quite fluid and difficult to discern. As such, the coding of Areas A, B, and C are best-guess approximations, based on the following coding rule: 1) Area A: within the bounds or at the entrance of a major Palestinian city, 2) Area C: In or at the entrance to an Israeli settlement, 3) Area B: open areas and any other small Palestinian towns and villages outside of the major cities, including most checkpoints and the border crossing with Jordan (Allenby Bridge). Figure 4 below shows the official Oslo delineation of each

area, however, as described above, our data only approximate this information. Other areas in our dataset are: 4) Israel Proper, 5) Jerusalem (both East and West), and 6) Gaza Strip.

**Figure 4:** Oslo Areas A, B, and C.

The West Bank and Gaza Strip are divided into 16 governorates, 11 in the West Bank and 5 in the Gaza Strip. Figure 5 below shows the geographic areas that each governorate includes. Deir El Balah is also sometimes referred to as the Central Gaza governorate and is referred to as such in our data.

**Figure 5:** Governorates of Palestine

Events perpetrated by both Israelis (NAD) and Palestinians (Meir Amit) also typically have location data down to the “City” or “Town” level (e.g. “Sderot,” “Ramat HaSharon,” “Bir Zeit,” “Beit Fajjar”). In cases where the city is not available, a lower-order region is often specified, such as “Western Negev” or “Jordan Valley.” A complete list of all cities/towns include in the dataset is in Table 2 and Table 3 below. Some spaces that experienced a particularly high level of violence are coded as towns even when they are lower-level geographic regions, such as neighborhoods. So, for example, events occurring near the Al Aqsa mosque are coded as Al Aqsa, the Container Checkpoint also received its own delineation, and some events are listed as “Israel-Gaza Border,”<sup>8</sup>

<sup>8</sup>We made decisions as to what side of the border the violence would have occurred based on clear context clues (e.g. attack on an IDF force originating in Gaza was likely in Israel since the soldiers are usually on the Israeli side of the fence or crowd dispersals usually happen on the Palestinian side because that is where they would be

Towns marked with \* are geocoded

Translating granular events into accurate geographically coded data (see next section), requires an immense level of specificity to be reported. This required specificity, however, was often absent from both sides' reporting. There are various reasons the reports lacked key detail or in some cases accuracy regarding

the location of reported events. As such, processing of the entire dataset included a rigorous geographical reconciliation process that followed cross-validation.

Location data was reconciled to find the most accurate town and city name at the lowest level but to also ensure the accuracy of that data to the higher levels of organization including governorate, area, and region depending on source of the report. Each town and city name were reconciled by first checking against the verbatim text. While coders and cross-validators were instructed to use the most common spelling of Town and City names, translation errors caused spelling variations of a single town/city that needed to be fixed in this reconciliation process. Thus, a core step of the reconciliation process included referencing the Arabic or Hebrew reports, if available, to consolidate the spelling of town and city names.

Next, these town and city names were reconciled with public research and maps to match the most used spellings of these locations. In this phase, issues of biases and underrepresentation became clear. For example, in NAD reports, areas of land, especially around settlements or in less populated areas, are often referred to by historic or Palestinian preferred names and the parallel is done in Meir Amit reporting. Some of these variations are indicative of the shifts in control or the reorganization of land over time in the region. For example, Harmala is a frequently named town where events were reported. However, we coded this town as Jannatah to reflect that this town and others were merged to form Jannatah in 1996. Similarly, towns or settlements no longer in existence are occasionally named in both organizations' reporting and required detailed researching to derive the contemporary town name or most recognizable historic name.

Finally, underrepresentation and geographical reporting of the region was the final barrier to reconciling to more precise names of towns/cities. For example, many towns in the West Bank and Gaza are not clearly reported on or consistently represented on maps. While this level of the reconciliation process included the broadest scope of researching and examining of publicly accessible maps, many towns in governorates like Tubas, Hebron, and the entire Gaza Strip were difficult to exactly locate. Similarly, in some cases where events at checkpoints, settlements, or camps were created on land *between* towns or cities we indicated this by separating the names by comma. In cases where reported events occurred in land between Governorates or Regions, we made case-by-case determinations as to which governorate/region was most appropriate based on distance and historical information on what towns or cities the land historically was claimed to be a part of.

## 4.5 Geo-Location

Almost every city or town in our dataset has also been geo-coded using ARCGIS and other sources. Given that the same City or Town might appear multiple times throughout the dataset, we created a list of all unique Region-City or City-Town combinations in the two datasets. In both cases, we did some minor text clean-up, most notably removing any leading punctuation in the City or Town names since the inclusion of this punctuation was not consistent. The list of Region-City combinations was quite straightforward, with only 386 combinations that needed to be geocoded. The list of City-Town combinations was more complicated, since there were over 3 thousand combinations and many of the smaller towns, which often occurred fewer than 5 times in the dataset, had alternative names that would be easier to find on a map. Working with a RA, we reviewed every combination to ensure to the best of our ability that the town names were standardized. This ultimately led to a list of 989 combinations that needed to be geocoded.

The Region-City and City-Town lists were joined to shapefiles from GADM to increase the accuracy of geocoding. Using ArcGIS Pro's geocoding algorithm, we then geocoded the lists, looking for matches in populated places (such as cities, towns, neighborhoods, etc.). Matches that were automatic from the algorithm are indicated with an "A". In some cases the "match" was incorrect but ArcGIS's list of possible alternatives included the correct match, or that list of possible alternatives included a better match (i.e. same location, but more complete information). In these cases, we manually switched to the correct or better match. These are indicated with an "M". The vast majority of pairs did not have a true match or were unmatched by the algorithm. We reviewed each of these pairs manually, finding their coordinates in this order: finding the name of the City or Town on the ArcGIS base map; finding the coordinates on Google Maps and then manually entering them in ArcGIS Pro; finding the coordinates on the City or Town's Wikipedia page and then manually entering them in ArcGIS Pro; referencing the possible location based off of maps generated by OCHA; Google searches for the City or Town name might generate hits that either provided coordinates or gave a general location that we could identify, such as "between Town A and Town B". The pairs that were matched in this manner are indicated as "PP". A small proportion of the Towns appeared to have no alternative name, but we could also not find coordinates. While ArcGIS Pro generates several columns of information for the "A" and "M" match types, of which we have provided a small subset, only the "X" and "Y" coordinates are generated for the "PP" match types. In our dataset, we have included the Type of populated place (if applicable), the name and address of the place per the ArcGIS database (if

applicable), and the X and Y coordinates of that City or Town. Since some observations include several City or Town fields, the geocoded information was joined as many times as necessary (8 in the Palestinian Violence dataset, 6 in the Israeli Violence Dataset) to ensure that every possible combination included a geolocation.

## 4.6 Violence Type

Each event in the data includes detailed information on the *type* of violence (Primary.Violence). The types of violence differ slightly depending on the perpetrator.

In the Israeli violence data, attack types include: Raid, Military Checkpoint, Flying Checkpoint, Beating/Assault, Air Patrol, Destruction of Property, Confiscation of Property, Naval Boarding/Blockade, Air Raid, Shooting, Crowd Dispersal, Vehicular, Home Demolition, Home Occupation, Closure, Harassment, Tank/Artillery, Deportation, and Detention.

1. **Raid:** When Israeli military forces enter Palestinian areas to, e.g., run patrols, search for suspects, conduct surveillance, make arrests, or accompany Israeli civilians.
2. **Military Checkpoint:** New activity reported at permanent checkpoints, such as intensified restrictions, or activities by soldiers against Palestinians that occurs at checkpoints such as harassment, detention, or assault.
3. **Flying Checkpoint:** Non-permanent checkpoints set up by Israeli forces.
4. **Beating or Assault:** Physical assault, including stone-throwing.
5. **Air Patrol:** Aerial patrols by Israeli without live fire.
6. **Destruction of Property:** Demolition of structures or buildings that are not houses. Includes vandalism perpetrated by soldiers and civilians and “land levelling” by Israeli forces.
7. **Confiscation of Property:** Confiscation of land and/or property by Israeli forces. Includes theft by civilians.
8. **Naval Boarding/Blockade:** Enforcement of the naval blockade by Israeli forces, usually warning shots fired at boats that veer from the Gaza coast. Includes boarding of boats by Israeli forces.
9. **Air Raid:** Bombing runs by the Israeli airforce. Includes drone strikes.
10. **Shooting:** Live fire used by Israeli forces. Includes warning shots that do not result in bodily harm.

May also include shootings by Israeli civilians.

11. **Crowd Dispersal:** The use of crowd control tactics by Israeli forces, including rubber bullets, tear gas, noise bombs, etc.
12. **Vehicular:** Events where the vehicle is the weapon. This may include traffic accidents where the driver is Israeli and the victim is Palestinian.
13. **Home Demolition:** Demolition of fully constructed or partially constructed houses by Israeli forces. Includes notices of planned demolition.
14. **Home Occupation:** Use of a private residence by Israeli forces either for training or during raids in which the family is either not allowed to enter the home or is confined within it.
15. **Closure:** Closure of an area, region, road, public space or building by Israeli forces. In the case of long-term closures (more than 1 week), coders will mark only the first day of the closure, rather than each day as a new closure. Occasionally, specific individuals or categories of individuals would be barred from locations (e.g. the al Aqsa mosque). These were also coded as closures.
16. **Harassment:** Disruptive behavior against Palestinians that falls short of physical violence or destruction of property. Often, but not always, includes negative interactions between Palestinians and Israeli settlers.
17. **Tank/Artillery:** The use of tanks or other land-based artillery (shells, etc.) by Israeli forces. This also includes UXO (unexploded ordinance) that goes off accidentally.
18. **Deportation:** When individual Palestinians are not allowed to return to a specific area (e.g. their hometown), often after release from prison as a condition of their release.
19. **Detention:** When a Palestinian(s) is listed as detained or arrested by Israeli officials. An event is only coded as Detention for its primary classification if there is no other information about the event. In other words, if a detention occurred at a flying checkpoint, the event is a 'Flying Checkpoint', but the individual is marked as detained in the 'Number Detained' variable. Thus, the best way to examine detentions by the Israeli army is to use the *Number Detained* variable, rather than the *Attack Type* variable.

In the Palestinian violence data, the potential attack types are: Rocket/Mortar, Incendiary Balloon,<sup>9</sup>

---

<sup>9</sup>A separate variable includes either the number of incendiary balloons or number of rockets included in an attack. When the barrage is particularly large, the Meir Amit Center gives approximations of the numbers of rockets and we use the most conservative number in the range.

Bombing, Shooting, Vehicular, Stabbing, Kidnapping, and Riot. Riot is further subdivided into four sub-categories: Stones, Incendiary, Arson, Property Damage, Violent Protest, Border/Blockade Breaching, or Assault.

1. **Rocket/Mortar:** Launching of rockets or mortars into Israel. Rockets that do not reach Israeli territory are still coded, but are marked as unsuccessful. Where possible, each rocket is separated into a separate attack. However, where separation is not possible, or multiple rockets are part of a single attack, the number of rockets are indicated in the “Rocket.Number” variable.

- *Number of Rockets:* The number of rockets launched in an event. When exact numbers are not reported, the lowest possible estimate is reported (e.g. “more than 100” is reported as 101. “Several” is reported as 4.)

2. **Incendiary Balloon:** Launching of balloons into Israel with some incendiary feature attached (IED, cloth on fire, etc.). Balloons that do not reach Israeli territory are still coded, but are marked as unsuccessful. Where possible, each balloon is separated into a separate attack. However, where separation is not possible, or multiple balloons are part of a single attack, the number of balloons are indicated in the “Balloon.Number” variable.

- *Number of Incendiary Balloons:* The number of balloons launched in an event. When exact numbers are not reported, the lowest possible estimate is reported (e.g. “more than 100” is reported as 101. “Several” is reported as 4). Often these balloons are reported due to their results (e.g. fires). If a report lists 5 fires, then 5 balloons are assumed to have been launched.

3. **Bombing:** Bombs (makeshift or otherwise) planted by Palestinians. This includes IEDs placed on roads (makeshift IEDs thrown during Riots go under the Riot category). Also includes suicide bombs. Bombs that are found before going off are coded, but listed as unsuccessful.

4. **Shooting:** Use of live fire by Palestinians. Guns confiscated at checkpoints or in other caches are coded as failed shootings.

5. **Vehicular:** Events where the vehicle is the weapon. This may include traffic accidents where the driver is Palestinian and the victim is Israeli.

6. **Stabbing:** Physical attacks by Palestinians using knives. Knives confiscated at checkpoints or in other caches are coded as failed stabbings.

7. **Kidnapping:** Attempts to forcibly capture and hold Israeli soldiers or civilians. Planned kidnappings where no one is taken are still coded, but listed as unsuccessful.
8. **Sabotage:** Purposeful destruction of military equipment by Palestinians
9. **Infiltration:** Attempts by Palestinians to enter Israel from the Gaza Strip or West Bank. This includes attempts to illegally cross for employment purposes.
10. **Riot:** Violent public disorder by Palestinians. Is further sub-divided into the following categories:
  - *Stones:* throwing stones
  - *Incendiary:* throwing incendiary devices (Molotov cocktails, IEDs)
  - *Arson:* deliberately setting fires
  - *Property Damage:* vandalism or other destruction of property
  - *Violent Protest:* protests with unspecified violent elements
  - *Border/Blockade Breaching:* protests where Palestinians attempt to forcibly bypass Israeli borders or checkpoints
  - *Assault:* physical altercations between Palestinians and Israelis that may or may not result in injuries

Each event has a primary classification and, if necessary, a second and tertiary classification (Secondary.Violence.1, Secondary.Violence.2, etc.). Depending on the specific nature of a multi-part event, it may be coded as one event with multiple classifications or as separate, distinct events. For example, events that take place in multiple locations at the same time are coded as separate events. Events where the Israeli military gets involved after an initial confrontation between settlers and Palestinians, for example, is also typically coded as two events: one perpetrated by Israeli civilians (e.g. assault) and one by the Israeli Army (e.g. crowd dispersal). On the other hand, a vehicular attack by a Palestinian who then begins shooting at the crowd is coded as a single event with two classifications. When events have multiple violence types, the subjectively defined “main” part of the event and/or the “more severe” type of violence is coded as the primary classification.

When there are two types of violence in an event, coders were instructed to code the most severe one as the primary (e.g. shooting and assault, shooting is primary). The exception is “firing live fire” in the context of crowd dispersal. In this case, Crowd Dispersal was still coded as primary, unless someone was killed in

the shooting. Another exception is a raid. If an assault or other event happens in the context of a raid, coders listed the raid as primary.

## 4.7 Consequence, Number Detained/Arrested

In the Palestinian violence data (Meir Amit) there is a “Consequence” variable indicating whether the perpetrators were: 1) at large, 2) killed, or 3) arrested. When perpetrators are reported as injured, they are presumed to have been arrested. When there are multiple perpetrators with potentially different statuses (e.g. some are at large while one or two was killed or arrested, we coded both types of “Consequence” separated by a comma).

In the Israeli violence data (NAD) there is a “Detained.Arrested” variable indicating how many Palestinians were detained or arrested by Israeli forces. This covers a large range of time, from temporary detentions in which Palestinians go through additional security checks to arrests for alleged crimes, and sentences to jails. This is a numeric variable that takes on a value of zero if no detentions or arrests are reported. When exact numbers are not reported, we take the lowest estimate (e.g. “several” is four).

## 4.8 Perpetrator & Victim

Each event includes information on the perpetrator and the victim. In the Israeli violence dataset (NAD), the Perpetrator can be either: 1) Israeli Military, 2) Israeli Police<sup>10</sup>, or 3) Israeli Civilians. When there are multiple perpetrators, each is listed separately (Perpetrator.1, Perpetrator.2).

In the Palestinian violence data (Meir Amit), the Perpetrator.Origin is listed: 1) West Bank, 2) Gaza Strip, 3) Israel Proper, 4) Jerusalem, or 5) Foreign. When there are multiple perpetrators, perpetrator origins are listed separated by a comma. In addition, if available, information on the specific group that claimed responsibility – e.g. Hamas, Fatah, Palestinian Islamic Jihad – is also coded. Often, however, this category is left blank.

The datasets also incorporate detailed information on the identity of the victims of each act of violence. In the Israeli violence dataset, the Victim can be: 1) Palestinian Militant<sup>11</sup>, 2) Palestinian Civilian<sup>12</sup>, 3)

---

<sup>10</sup>This includes criminal prosecutions and cases in the judicial system

<sup>11</sup>An individual is coded as a militant if they were likely involved in violence *at the time* of the event. Stone throwing is not included as “violence.” All other forms of violence, including assault, attempted stabbing, and so on, are.

<sup>12</sup>Palestinian civilians are coded as the victims when an event is broad-based and likely to affect many non-militants,

Palestinian Government (e.g. a Palestinian security force officer of PA official), 4) Palestinian Child (anyone under 18, unless they are coded as a militant), 5) Israeli Civilian (e.g. an Israeli protestor), 6) Israeli Military (e.g. friendly fire), 7) PCI (Palestinian Citizen of Israel), or 8) Foreign. When there are multiple victims, each is listed (Victim.1, Victim.2, etc.).

In the Palestinian violence dataset, a victim can be: 1) Israeli Military, 2) Israeli Civilian, or 3) Israeli Government (including police).<sup>13</sup> For both datasets, if even one civilian is harmed in the attack, civilians are coded as one of the victims, even if the majority of casualties are from the military.

When the text is discussing the number of people affected by a event (e.g. summoned, killed, detained, arrested, injured), the coders were instructed to apply the following rules of thumb: “a couple” - code as 2; “a few” - code as 3; “several” - code as 4. Where these descriptors were not present, coders used the contextual details on a case by case basis to determine an approximate number in consultation with the PI.

## 4.9 Monetary Cost

A qualitative variable (Monetary.Cost) that indicates the monetary value or specific items destroyed or confiscated in ‘Destruction of Property’ or ‘Confiscation of Property’ events.

## 4.10 Casualties

Two variables are included for all events that included the number of people that were 1) Injured or 2) Killed in an event. This variable is coded conservatively. For example, Israelis ‘treated for shock’ are not counted as injured, nor are Palestinians ‘suffocated from tear gas’ unless some other consequence is mentioned (e.g. they are hospitalized as a result). The Casualties variable sums these two columns together. We follow the same rules of thumb re: generic numbers as specified above (e.g. several = 4).

## 4.11 Event Context

Finally, each dataset includes variables that provide some basic context for the event. In the Israeli violence data, for example, there is a variable “Responsive” that receives a value of 1 if the Israeli perpetrator is

---

such as checkpoints

<sup>13</sup>Rarely, foreign civilians are injured or killed and this is included with Israeli Civilian.

responding to Palestinian violence on the ground *at that time*. In other words, if Israeli forces shoot a Palestinian who is attempting to stab an Israeli soldier, the event would be a ‘shooting’ and it would be coded as responsive. This variable is coded very conservatively, in that, unless there is direct evidence in the report itself that a Palestinian was engaging in some act of violence at that exact moment, the Israeli action is coded as independent (e.g. as pre-planned, rather than responsive to immediate events on the ground).

The below list details some circumstances under which Israeli actions are coded as “Responsive”:

- for alleged stoning
- allegedly entering Israel without proper permits.
- alleged stabbing, allegedly attempting to stab an Israeli soldier
- allegedly finding a knife inside their vehicle
- alleged gunfire
- alleged firebombing
- allegedly digging in a restricted area

On the Palestinian side, I incorporate a variable that indicates whether the attack was ‘Successful’ (‘1’). Success is measured not by casualties, but rather whether the attack was actually *launched*. If it was disrupted prior to the beginning of the attack or fails to breach Israel’s borders (in the case of rockets/balloons), it is coded as unsuccessful (‘0’).

## **4.12 Verbatim Report**

Each event includes the text from the original report (Verbatim.Report) that was used to code the event. In addition, each event contains the link to the full original report (Link.Report). Where applicable, the verbatim text and link of updates to the event reported after the original event are also included here. This increases transparency and replicability of the dataset.

## 5 Covariates

### 5.1 Economic Covariates

#### 5.1.1 Monthly Consumer Price Index in Israel & Palestine

Data is from the **CEIC** Global Database. It is at the monthly level, i.e. every day in a calendar month has the same value. There are no missing values.

#### 5.1.2 Monthly & Quarterly Unemployment Rates in Israel & Palestine

Data is from the **CEIC** Global Database. For Israel, data is available at both the monthly (starting in January, 2012) and quarterly level, while for Palestine data is only available at the quarterly level. For the monthly data, every day in a calendar month has the same value; for the quarterly data, every day in a quarter has the same value. There are no missing values.

#### 5.1.3 Daily Recession Indicators in Israel

Data is from the Federal Reserve Bank of St. Louis Economic Research (**FRED**). ISRECD equals 1 if there is a recession, 0 otherwise. It is at the daily level. There are no missing values.

#### 5.1.4 Monthly Trade Balance in Israel & Palestine

Data is from the **CEIC** Global Database. It is at the monthly level, meaning that every day in a calendar month has the same value. There are no missing values.

#### 5.1.5 Daily Stock Market Closing Prices in Israel & Palestine

The closing price for Israel is the TA-125 index, an index comprised of the top 125 firms (out of 473) on the Tel Aviv Stock Exchange (TASE). Data is from **Bloomberg**, and is at the daily level. The closing price for Palestine is the Al-Quds index, an index comprised of the top 15 firms (out of 48) on the Palestine Stock Exchange (PEX). Data is from the **PEX** and is at the daily level. There are missing values for the days the markets are closed. In those cases, missing values are imputed using last observation carried forward. Both TASE and PEX had closing values for January 1, 2009.

### 5.1.6 Daily Exchange Rate of Israeli Shekel to USD

Data is from the **Bank of Israel**. It is at the daily level. There are missing values for the days the markets are closed; in those cases, missing values are imputed using last observation carried forward. For the beginning of the dataset in January 2009, value from December 31, 2008 are used.

### 5.1.7 Monthly Crossing Information of People & Goods into/from Gaza Strip

Data is from the United Nations Office for the Coordination of Humanitarian Affairs (**OCHA**). It is at the monthly level, meaning that every day in a calendar month has the same value. More information about each crossing data is outlined below:

- **Rafah Crossing, People:** Data includes the (raw) number of people who entered, the number of people who exited, the total movement (which is the combined total number of entries and exists), the number of days the crossing is open, and the number of days the crossing is closed (which is the open days subtracted from the total number of days in the month). There are no missing values.
- **Erez Crossing, People:** Data includes the (raw) number of people who entered, the number of people who exited, and the total movement (which is the combined total number of entries and exists). There are no missing values for the total movement variable. Some entries and exits are shown as missing because total movement equals 0. In those cases, the missing values are imputed as 0s. In addition, there are some missing values for the entries variable, but no missing values for the total movement and exits variables. In those cases, the values are imputed as the total movement minus the exits. Note that OCHA also has data on commodities crossing, but all but 2 months are missing values (and those 2 months have a value of 0), so the data is not included here.
- **Rafah Crossing, Commodities:** Data includes the number of truckloads imported, the number of truckloads exported, and the total entries and exits (which is the combined total of imports and exports). All but one month has a missing export value. When possible, it is imputed as the total entries and exits minus imports. There are 61 months of missing values for the total entries variable, and in all cases the values for both imports and exports are missing as well. First, we impute missing variables using last observation carried forward. Then, if there is 0 movement of people that month, we overwrite the data with 0s for imports, exports, and total entries and exits.

- Karni Crossing, Commodities: Data includes the number of truckloads imported, the number of truckloads exported, and the total entries and exits (which is the combined total of imports and exports). All export values are missing, but since for every month total imports and total entries and exits are the same value, exports are imputed as 0 for every month. There are 87 months of missing values for the total entries variable, and in all cases the values for both imports and exports are missing as well. All missing values are imputed as 0s.
- Kerem Shalom Crossing, Commodities: Data includes the number of truckloads imported to Gaza, the number of truckloads exported from Gaza, the total imports and exports to the West Bank, and the total entries and exits (which is the combined total of the other three values). There are no missing values for the total entries and exits variable or the imports to Gaza variable. The missing values for the West Bank and Exports to Gaza variables are calculated using the three other variables. No other imputation is needed.
- Sufa Crossing, Commodities: Data includes the number of truckloads imported, the number of truckloads exported, and the total entries and exits (which is the combined total of imports and exports). All export values are missing, but since for every month total imports and total entries and exits are the same value, exports are imputed as 0 for every month. There are 112 months of missing values for the total entries variable (and of the remaining values, only 2 are non-zero), and in all cases the values for both imports and exports are missing as well. All missing values are imputed as 0s.

## 5.2 Political Covariates

### 5.2.1 Monthly and Daily Demolition Incidents in the West Bank

Data is from the United Nations Office for the Coordination of Humanitarian Affairs (OCHA). For each level, the included variables are Demolished Structures and Displaced People. The monthly data also includes Affected People.

For the daily data, missing dates are imputed with 0. For the monthly level data, every day in the calendar month has the same value. There are two months of missing values – May 2010 and October 2014. The missing monthly values for Demolished Structures and Displaced People are imputed with summed

calendar month totals from the daily level data, while the Affected People missing values are left as NA values.

### 5.2.2 Dates of Major Israeli Military Operations

Dates of major Israeli operations were determined by the researchers. It is at daily level. In the dataset, this variable indicates 1 if there is an ongoing operation, and 0 otherwise.

Operation Name	Date(s)	Notes
Operation Cast Lead	12/27/2008-1/18/2009	Gaza Flotilla Incident
Operation Sea Breeze	5/31/2010	
Operation Returning Echo	3/9/2012-3/14/2012	
Operation Pillar of Defense	11/14/2012-11/21/2012

### 5.2.3 Dates of Major International Speeches on Israel/Palestine

Data from the **United Nations**. It is at the daily level. In addition to these speeches, the researchers also added former US President Barack Obama's Cairo Address on June 4th, 2009. In the dataset, this variable indicates 1 for the day of the speech and 13 days after, 0 otherwise.

### 5.2.4 Dates of Israeli Elections

Data is from newspaper reports and is at the daily level. There are no missing values. In the dataset, one variable counts the number of days since the last election, and a second variable counts the number of days until the next election. This is useful since the day of the next election is not always known very far in advance.

### 5.2.5 Composition of Israeli Ruling Coalitions: Size & Ideology

Data is from newspaper reports and is at the government level (length of time varies), meaning that every day under the same government has the same value. There are no missing values. In the dataset, the variables

included are the size of the governing coalition and the government's ideology, which we define as the total number of "left wing" party seats subtracted from the total number of "right wing" party seats. The definition of left wing and right wing was discerned by authors. The following parties were classified as left-wing: Labor, Meretz, Gil, and HaTnuah. Right-wing parties were: Likud, Yisrael Beiteinu, Bait HaYehudi (Jewish Home), Kulanu, Derekh Eretz, Gesher, and New Right. Parties that were classified as centrist (and so excluded from the left-right calculation) were Yesh Atid, Blue & White, and Kadima. The two major religious parties Shas and United Torah Judaism were also excluded. No other parties were a part of the governing coalition during this time period.

### **5.2.6 Dates of Hamas-Fatah Reconciliation Talks**

Data for 2009 through 2017 from [Palestinian Journeys](#), and data from 2018 through 2020 from various news sources (Times of Israel, Jerusalem Post, Al Jazeera). It is at the daily level. In the dataset, this variable indicates 1 for ongoing talks, 0 otherwise.

### **5.2.7 Dates of UNSC and UNGA Votes on Israel/Palestine**

Data from the UN Digital Library. It is at the daily level. In the dataset, this variable indicates 1 on the day of the vote and 13 days after, 0 otherwise.

### **5.2.8 Days US Secretary of State is in Office**

The name, party, and tenure (in days) of the current US Secretary of State. In some cases there is no confirmed Secretary of State, e.g. between administrations. In those cases, missing values are imputed with "Acting."

### **5.2.9 Dates of US State Visits to Israel**

Data on Presidential visits to Israel from the [US Department of State](#), data on Vice Presidential visits to Israel from news sources, and data on Secretary of State visits from the [US Department of State](#). All are at the daily level. In the dataset, this variable indicates 1 for an ongoing official visit, 0 otherwise.

### **5.2.10 Dates of Israeli Visits to US**

Data from the **US Department of State**. It is at the daily level. In the dataset, this variable indicates 1 for an ongoing official visit, 0 otherwise.

## **5.3 Temporal Covariates**

### **5.3.1 Daily Temperature**

Data from the **US National Oceanic and Atmospheric Administration (NOAA)**, including all active weather stations throughout the time of study: Beer Sheva City; Beer Sheva; Ben Gurion; Bet Dagan; Elat; and Har Kenaan. The data is at the daily level. The average temperature (in degrees Fahrenheit on) for each city is calculated by NOAA, and there are no missing values. The daily average across all cities is the statistic added to the dataset.

### **5.3.2 Daily Rainfall**

Data from the **US National Oceanic and Atmospheric Administration (NOAA)**, including all active weather stations throughout the time of study: Beer Sheva City; Beer Sheva; Ben Gurion; Bet Dagan; Elat; and Har Kenaan. The data is at the daily level. The rainfall (in inches) is the raw total precipitation, and missing values are imputed using last observation carried forward.
